The program is used to find exact chemical structures, written in different tautomeric forms. Also, it is used to find ionic (or polar) chemical structures, anion(cation) being removed from search.

Next commands can be executed for search:

- Structure search

Performs search in the selected database for a given   structure
 After search will have been finished, all found structures would be marked   with bookmarks – see CheD help.

- SDF compare

The command should use when one wants to compare content of SD file with a database.

- Database compare

The command is used to compare chemical structures in CheD databases
