Data75706-12-6(Hazardous Substances Data) Leflunomide Leflunomide

Usage And Synthesis:

Chemical Properties: Off White Crystalline Solid UsageAn immunosuppressive. Inhibits T and B cell proliferation. Activity is attributed mainly to its metabolite, a malononitrile derivative, which is beleived to inhibit dihydroorotate dehydrogenase as well as several protein tyrosine kinases. Therape Biological ActivityImmunosuppressant agent. In vitro the active metabolite A77 1726 (RS-61980) inhibits dihydroorotate dehydrogenase ($K_i = 2.7 \mu M$) and de novo pyrimidine synthesis in T-cells; blocks lymphocyte cell cycle progression and proliferation. A77 1726 also inhibits anti-CD3/CD28-induced cytokine production in PBMC cells ($IC_{50} = 21-27 \mu g/ml$). In vivo reduces inflammation in several animal models of autoimmune disease, arthritis, asthma and graft rejection. Leflunomide
